A Project Synopsis of

STUDENT MANAGEMENT SYSTEM

Submitted for the partial fulfillment of the requirement for the degree of

Bachelor of Computer Applications (BCA)
Academic Session: 2023 – 2026
Department of Computer Applications

Submitted By

Mohammad Mashid Ali	Mohammad Sane Ali
Reg. No.: 5791	Reg. No.: 6123
Roll No.: 2303141	Roll No.: 2303131

Under the Guidance of

Ritesh Kumar Jha
Assistant Professor (CS & IT)
Department of Computer Applications

Submitted To
Department of Computer Applications
Netaji Subhas University, Jamshedpur

Date: _____ Place: Jamshedpur

ACKNOWLEDGEMENT

We would like to express our sincere gratitude and heartfelt thanks to all those who have directly or indirectly contributed to the successful completion of our project titled "**Student Management System**", submitted in partial fulfillment of the requirements for the award of the degree of Bachelor of Computer Applications (BCA) during the academic session 2023–2026. This project would not have been possible without the continuous support, guidance, and encouragement of many respected individuals.

First and foremost, we express our deep sense of gratitude to our respected Project Guide, **Mr. Ritesh Kumar Jha**, Assistant Professor (CS & IT), for his valuable guidance, constant encouragement, constructive suggestions, and continuous support throughout the development of this project. His knowledge, patience, and motivation helped us understand the project requirements clearly and complete the work successfully within the stipulated time.

We would also like to extend our sincere thanks to our respected Chancellor Sir, Registrar Sir, Dean Sir, and Head of the Department (HOD) for their leadership, administrative support, and encouragement. Their vision, academic guidance, and commitment to providing quality education created a positive learning environment that enabled us to complete this project successfully. We are also thankful to all faculty members and staff of the Department of Computer Applications for providing the necessary facilities, cooperation, and valuable suggestions during the preparation of this project.

Finally, we are deeply grateful to our parents, family members, friends, and the management and staff of our internship organization for their continuous encouragement, moral support, and cooperation throughout our academic journey. Their support and motivation played an important role in the successful completion of this project. We sincerely acknowledge the contribution of everyone who helped us in any way during the development of this project.

DECLARATION

We hereby declare that the project entitled "Student Management System" submitted in partial fulfillment of the requirements for the award of the degree of Bachelor of Computer Applications (BCA) to NSU, Jamshedpur, is a record of original work carried out by us under the guidance and supervision of Mr. Ritesh Kumar Jha, Project Guide, Department of Computer Applications.

We further declare that this project work has been completed by us independently and has not been submitted, either in part or in full, to any other university or institution for the award of any degree, diploma, or certificate.

We also confirm that all the information, data, and materials used in this project have been properly acknowledged and referenced wherever required. We have complied with all academic rules, regulations, and ethical standards prescribed by the institution. Any assistance received during the development of this project has been duly acknowledged in the acknowledgement section of this report.

We understand that any act of plagiarism or academic dishonesty, if found at any stage, may lead to cancellation of our project and disciplinary action as per the rules of the university.

This project represents our genuine effort and learning during the course of study in the Bachelor of Computer Applications (BCA) program for the academic session 2023–2026.

INTRODUCTION

The Student Management System is a web-based application designed to simplify and automate the process of managing student records within educational institutions such as schools, colleges, and universities. In the modern digital era, educational institutions handle large volumes of student data including personal details, course information, attendance records, and academic performance. Managing this data manually is time-consuming, error-prone, and inefficient, making a digital solution highly necessary.

In traditional student management practices, administrators and staff maintain records on paper or in unorganized spreadsheets. These manual methods are prone to data loss, inconsistencies, and difficulty in retrieval. Staff members often spend considerable time searching for records, updating information, and generating reports manually. As the number of students increases, these challenges become even more pronounced, reducing the overall quality and efficiency of administrative operations.

The proposed Student Management System provides a centralized, user-friendly web-based platform through which administrators can easily add, update, search, and delete student records. The system stores all student information in a structured database, enabling quick access and accurate retrieval of data at any time. It eliminates the need for paper-based records, reduces manual effort, and ensures data security through proper authentication mechanisms.

This project is developed using modern web technologies including HTML, CSS, JavaScript for the front-end interface, PHP for server-side processing, and MySQL as the database management system. The system is designed to run on a local server environment using XAMPP and can be accessed via a standard web browser. It provides a clean and responsive interface that allows administrators to perform all student-related operations efficiently.

In the future, the system can be extended to include additional features such as online student portals, attendance tracking, grade management, report generation, and notification systems. Overall, the Student Management System demonstrates the practical application of web development and database management technologies learned during the BCA program and contributes significantly to improving administrative efficiency in educational institutions.

OBJECTIVES OF THE PROJECT

The main objective of the Student Management System project is to design and develop a computerized web-based application that simplifies the process of managing student information in educational institutions. The system aims to provide a reliable, efficient, and user-friendly platform for administrators to store, retrieve, update, and manage student data with ease.

The specific objectives of the project are as follows:

1. To develop a centralized web-based system for storing and managing student information digitally.
2. To reduce manual work and paperwork involved in traditional student record management systems.
3. To provide a user-friendly interface that ensures easy navigation for administrators and authorized users.
4. To maintain accurate and up-to-date records of students including personal details, registration numbers, contact information, and course details.
5. To allow administrators to add, edit, update, and delete student records efficiently.
6. To provide a quick search and retrieval mechanism to access specific student information instantly.
7. To ensure data security and confidentiality through proper login authentication and access control mechanisms.
8. To minimize errors in data entry and improve the overall accuracy of student information management.
9. To generate structured records and reports related to student data for better administrative decision-making.
10. To enhance the overall efficiency and organization of administrative operations within educational institutions.

Overall, the objective of this project is to demonstrate the practical implementation of web development technologies and database management systems in solving real-world administrative problems in educational institutions.

PROBLEM STATEMENT

In traditional educational institutions, student records are maintained manually using paper-based registers, physical files, or unorganized spreadsheets. These conventional methods of managing student information are time-consuming, inefficient, and prone to numerous errors. Administrative staff must spend significant amounts of time manually recording, searching, updating, and managing large volumes of student data, which reduces overall operational efficiency and productivity.

Manual record-keeping systems present several critical problems. Physical records are susceptible to loss, damage due to fire or flood, misplacement, or unauthorized access. Searching for a specific student's record among thousands of paper files is a highly time-consuming and frustrating process. Updating information such as contact details, course changes, or academic performance requires considerable manual effort and often leads to inconsistencies across different records.

Another major issue is the lack of real-time access to student information. When multiple staff members need to access or modify student records simultaneously, manual systems become completely inadequate. There is no centralized database in traditional systems, leading to data duplication, inconsistency, and mismanagement. Reports and summaries that require compilation of data from multiple records take disproportionately long to prepare and are often inaccurate.

Furthermore, traditional systems do not provide adequate security for sensitive student information such as personal details, contact numbers, and academic records. Physical records can be accessed by unauthorized individuals, raising serious privacy and confidentiality concerns. There is also no backup mechanism in place, meaning that any loss of physical records results in permanent and irretrievable loss of critical data.

Therefore, there is a strong and urgent need for a computerized and automated Student Management System that can address these problems by providing a reliable, efficient, and secure digital platform for managing all student-related information. The proposed system aims to eliminate manual processes, reduce errors, centralize data storage, improve accessibility, and ensure the security and integrity of student records.

SCOPE OF THE PROJECT

The scope of the Student Management System project defines the boundaries, features, and functionalities of the system, and explains how it can be applied in real-world educational environments. The primary scope of this project is to develop a web-based application that enables administrators to manage student records digitally and efficiently, replacing the need for manual paper-based systems in schools, colleges, and universities.

The project covers essential functionalities including administrator login with authentication, adding new student records, viewing the complete list of students, searching for specific students by name or registration number, updating existing student information, and deleting records when required. The system also maintains structured records in a relational database, ensuring organized and consistent storage of data with quick retrieval capabilities.

An important aspect of the project scope is the management of student data fields such as the student's full name, registration number, roll number, contact number, email address, course name, semester, section, and address. All this information is stored securely in a MySQL database, ensuring data integrity and easy maintenance. The system supports both individual record operations and bulk record management through a structured administrative interface.

The scope of this project is primarily limited to the development of a web-based system using technologies such as HTML, CSS, JavaScript, PHP, and MySQL. The system is designed to operate on a local server environment using XAMPP and can be accessed through any modern web browser. It is intended for use by designated administrators and authorized staff members within the educational institution.

In the future, the system can be expanded to include additional features such as student login portals, online attendance management, grade tracking and result processing, fee payment management, notification and alert systems, mobile application integration, and cloud-based hosting. These enhancements would significantly increase the scalability, accessibility, and usability of the system for larger institutions and multi-branch organizations.

METHODOLOGY / TECHNOLOGY USED

The development of the Student Management System follows a systematic and structured methodology to ensure the successful design, implementation, and testing of the application. The project is developed using the Software Development Life Cycle (SDLC) approach, which includes several stages such as planning, analysis, design, development, testing, implementation, and maintenance.

In the planning phase, the project requirements were identified, and the objectives of the system were defined based on the limitations of traditional manual student record management. In the analysis phase, detailed information about user requirements, system functionalities, and data processing needs was collected and documented. During the design phase, the system architecture, database structure, and user interface layouts were planned using Data Flow Diagrams (DFD) and Entity Relationship (ER) diagrams.

The development phase involved writing program code using appropriate programming languages and tools to implement all required system features. The testing phase ensured that the system functions correctly through unit testing, system testing, and user acceptance testing to identify and resolve any bugs. After successful testing, the system was implemented and made available for use by administrators.

Front-End Technologies

HTML (HyperText Markup Language): HTML is used to create the basic structure of all web pages in the Student Management System. It defines elements such as forms, tables, buttons, input fields, and links that allow administrators to interact with the system.

CSS (Cascading Style Sheets): CSS is used to design and format the visual appearance of all web pages. It is responsible for creating attractive layouts, consistent color schemes, fonts, spacing, and responsive designs that enhance the user experience.

JavaScript: JavaScript is used to add interactivity and dynamic features to the system. It handles client-side form validation, displays real-time feedback messages, and improves the responsiveness and usability of the application without requiring page reloads.

Back-End Technologies

PHP (Hypertext Preprocessor): PHP is the primary server-side scripting language used to handle all user requests, process form data, manage user sessions, execute database queries, and implement the core business logic of the system. PHP acts as the bridge between the front-end interface and the MySQL database.

MySQL: MySQL is the relational database management system used to store and manage all student data including personal details, course information, registration numbers, and contact details. MySQL ensures secure, structured, and efficient storage and retrieval of all system data.

Development Tools

- Visual Studio Code: Used as the primary code editor for writing, organizing, and managing all program files.
- XAMPP Server: Used to set up and run a local web server and MySQL database environment for development and testing.
- Google Chrome / Web Browser: Used to test and run the web-based application during development.
- phpMyAdmin: Used for visual management of the MySQL database, including creating tables, entering test data, and executing queries.
- Operating System: Windows 10 or higher, used as the development and execution platform.

HARDWARE AND SOFTWARE REQUIREMENTS

Hardware Requirements

S.No.	Component	Minimum Requirement	Recommended
1	Processor	Intel Core i3	Intel Core i5 or higher
2	RAM	4 GB	8 GB or more
3	Storage	500 GB HDD	1 TB HDD / SSD
4	Display	1024x768 Monitor	1920x1080 Full HD
5	Input Devices	Keyboard & Mouse	Standard
6	Network	LAN / Wi-Fi	Broadband Internet
7	Printer	Optional	For printing reports

Software Requirements

S.No.	Software	Version / Type	Purpose
1	Operating System	Windows 10 / 11	Platform for development & execution
2	HTML / CSS / JavaScript	HTML5 / CSS3 / ES6	Front-end structure, styling & interactivity
3	PHP	PHP 7.4 or higher	Server-side scripting & backend logic
4	MySQL	MySQL 5.7 or higher	Database management & data storage
5	XAMPP	Latest version	Local web server & DB environment
6	Visual Studio Code	Latest version	Code editor & development IDE
7	Google Chrome / Firefox	Latest version	Web browser for testing & usage
8	phpMyAdmin	Bundled with XAMPP	Database design & query management

EXPECTED OUTCOME

The Student Management System is expected to provide an efficient, reliable, and user-friendly digital platform for managing student records in educational institutions. The successful implementation of this system will significantly simplify the administrative process of maintaining student data, reduce the workload of administrative staff, and eliminate the inefficiencies associated with traditional manual record-keeping methods.

One of the major expected outcomes of this project is the effective digital management of all student-related data through a structured and secure database system. The system will store complete student details including names, registration numbers, roll numbers, contact information, course details, and section information in an organized manner, allowing easy access and retrieval whenever required. This will help institutions maintain accurate and up-to-date records at all times.

Another important expected outcome is improved operational efficiency within educational institutions. The system will enable administrators to add, update, delete, and search for student records within seconds, dramatically reducing the time spent on administrative tasks. It will also eliminate paper-based processes, reduce the risk of data loss, and ensure consistent and accurate information across all student records.

The system is also expected to provide a secure environment for student data management through administrator authentication and access controls, ensuring that only authorized personnel can view or modify sensitive information. Additionally, the organized database structure will make it easy to generate accurate reports and summaries as required by institutional management.

Overall, the Student Management System will demonstrate the practical application of web development and database management technologies learned during the BCA program and will contribute to improving the quality, efficiency, and reliability of student data management in educational institutions. In the future, this system can be further enhanced with additional features to serve larger organizations.

CONCLUSION

The Student Management System project has been successfully designed and developed to provide an efficient, automated, and centralized solution for managing student records in educational institutions. The system replaces traditional manual and paper-based methods with a modern, computerized web-based platform that significantly improves the speed, accuracy, and reliability of student data management. It provides a clean and intuitive interface that allows administrators to perform all necessary record-keeping operations with ease.

This project has demonstrated the practical application of web development technologies and database management systems studied during the Bachelor of Computer Applications (BCA) program. The system enables administrators to add new student records, update existing information, search for specific students, and delete records when required, all through a secure and organized web interface backed by a MySQL database. It effectively eliminates the need for paper records and significantly reduces the chances of data loss, errors, and inconsistencies.

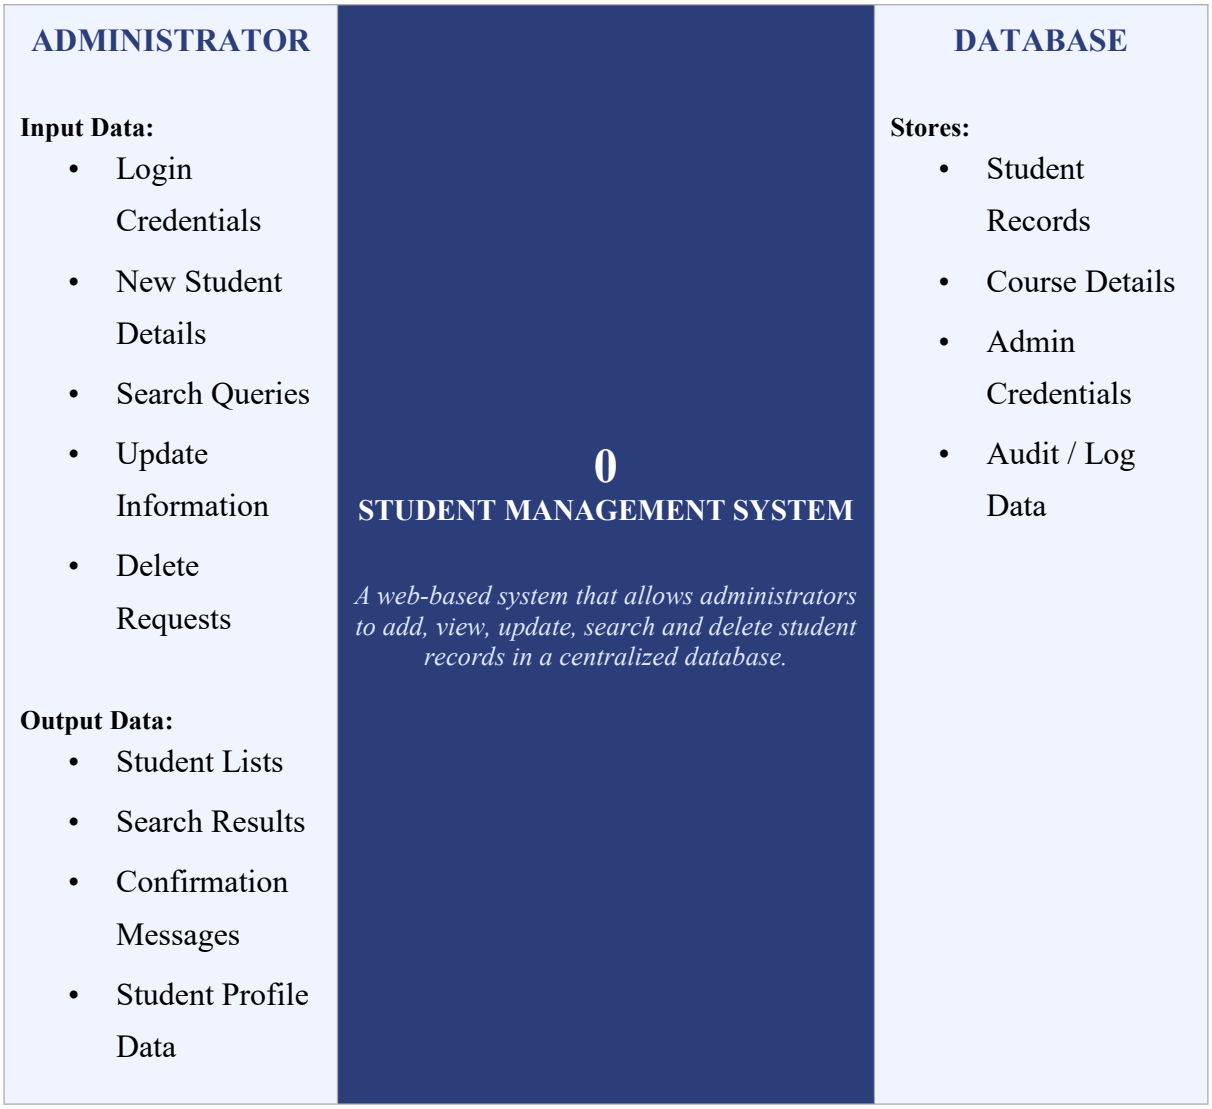
The implementation of the Student Management System contributes to improved administrative efficiency by providing instant access to student information, reducing manual effort, and ensuring data security through authentication mechanisms. The structured database design ensures proper organization of data and supports efficient retrieval and management of student records at all times. The system also lays a strong foundation for future enhancements.

In the future, the system can be expanded by incorporating additional features such as online student portals, attendance management, grade and result processing, fee payment tracking, report generation, notification systems, and mobile application support. These improvements will greatly increase the scalability and usability of the system for larger educational organizations. Overall, the project fulfills all its stated objectives and highlights the important role of information technology in modernizing and improving administrative operations in educational institutions.

DATA FLOW DIAGRAM (DFD) – LEVEL 0

The Data Flow Diagram (DFD) Level 0, also known as the Context Diagram, represents the overall structure of the Student Management System as a single process. It shows how the system interacts with the external entity — the Administrator — who is the primary user of the system. This diagram provides a high-level view of the system and illustrates the flow of data between the user and the system without showing internal processes in detail.

The single central process (Process 0) represents the entire Student Management System, which handles all activities related to student record management including adding new records, viewing existing records, updating information, searching, and deleting records. The Administrator provides inputs such as login credentials, student details, and search queries, and receives outputs such as student lists, search results, and confirmation messages.



The Context Diagram clearly shows that the Administrator is the sole external entity interacting with the Student Management System. All input data flows from the Administrator into the system, which then processes the data, interacts with the database, and returns appropriate output back to the Administrator.

DATA FLOW DIAGRAM (DFD) – LEVEL 1

The Data Flow Diagram (DFD) Level 1 provides a detailed breakdown of the main process of the Student Management System into smaller sub-processes. It explains how data moves between different components of the system, including the administrator and various databases. This level shows the internal working of the system and how each function is performed step by step.

The Level 1 DFD divides the main system into several key processes: Authentication Management, Student Record Management (Add/View/Update/Delete), and Search and Reporting. Each process interacts with specific data stores to complete its tasks efficiently.

Process	Process Name	Input Data	Output / Data Store
1.0	**Authentication Management**	Login credentials (Username, Password)	Session token → D1: Admin DB
2.0	**Add Student Record**	Student Name, Reg No, Roll No, Course, Contact, Section	Student data → D2: Students DB
3.0	**View Student Records**	View request from Admin	All student records from D2
4.0	**Update Student Record**	Updated student fields + Student ID	Updated data → D2: Students DB
5.0	**Delete Student Record**	Student ID / Reg No	Deletion confirmation → D2
6.0	**Search Student**	Name or Registration Number	Matched records from D2

The Level 1 Data Flow Diagram provides a clear and detailed representation of how the Student Management System operates internally. It shows the interaction between processes, data stores, and the external administrator entity. This diagram helps in understanding the complete workflow of the system and ensures proper system design and implementation.

DATA FLOW DIAGRAM (DFD) – LEVEL 2

The Data Flow Diagram (DFD) Level 2 provides a more granular and detailed view of the internal sub-processes within each major process identified in Level 1. It breaks down each major process into smaller, more specific operations to clearly show how data flows step by step within the Student Management System.

2.0 Add Student Record — Detailed Sub-processes

Sub-Process	Name	Description	Data Store
2.1	**Capture Input Data**	Admin fills the Add Student form with all required fields.	Form buffer
2.2	**Validate Input**	System validates all inputs (empty check, format check for email/phone).	Validation engine
2.3	**Check Duplicate**	System verifies Reg No. does not already exist in the DB.	D2: Students DB
2.4	**Save Student Record**	If valid & no duplicate, insert new record into the students table.	D2: Students DB
2.5	**Confirm Success**	System displays a success message and reloads the student list.	Admin Interface

The Level 2 DFD provides a comprehensive and detailed representation of the internal operations of the Student Management System. It explains how each function is performed step by step and how data flows between processes and databases, ensuring proper system design and efficient data management.

ER DIAGRAM (ENTITY RELATIONSHIP DIAGRAM)

In the Student Management System, the main entities include Student, Course, Administrator, and (optionally in future) Attendance and Results. These entities interact with each other to store and manage student data effectively. The ER diagram ensures data consistency, integrity, and efficient data retrieval across the system.

Main Entities and Relationships

Entity	Key Attributes	Relationships
STUDENT	Student_ID (PK), Student_Name, Reg_No (UQ), Roll_No, Email, Phone, Address, Password	One STUDENT belongs to one COURSE (M:1). One ADMINISTRATOR manages many STUDENTs (1:N).
COURSE	Course_ID (PK), Course_Name, Semester, Department, Duration	One COURSE can have many STUDENTs enrolled (1:N).
ADMINISTRATOR	Admin_ID (PK), Admin_Name, Email (UQ), Phone, Password	One ADMINISTRATOR manages many STUDENT records (1:N).
STUDENT_COURSE	StudentCourse_ID (PK), Student_ID (FK), Course_ID (FK), Section, Enroll_Date	Bridge table linking STUDENT and COURSE (M:N relationship).

The Entity Relationship Diagram provides a clear understanding of how different entities in the Student Management System are connected. It helps developers design a well-structured database and ensures smooth system operation. The ER diagram plays a vital role in maintaining accurate and reliable data within the system.

ENTITIES, ATTRIBUTES, AND RELATIONSHIPS

1. Entities

An Entity represents a real-world object or concept about which data is stored in the system. In the Student Management System, the main entities are:

11. Student
12. Course
13. Administrator
14. Student_Course (Junction Table)

2. Attributes of Entities

Attributes are the properties or characteristics of an entity. The attributes for each entity in the Student Management System are as follows:

STUDENT Entity:

Field Name	Data Type	Size	Key	Description
Student_ID	INT	10	**PK**	Unique ID for each student
Student_Name	VARCHAR	100		Full name of the student
Reg_No	VARCHAR	20	**UQ**	Registration number (unique)
Roll_No	VARCHAR	20		Roll number assigned
Email	VARCHAR	100	**UQ**	Student email address
Phone_Number	VARCHAR	15		Contact number
Address	TEXT	—		Residential address
Section	VARCHAR	10		Class section (A/B/C)
Password	VARCHAR	100		Login password (hashed)
Course_ID	INT	10	**FK**	Reference to Course table

3. Relationship Summary

- One STUDENT belongs to one COURSE (Many-to-One: N:1)
- One COURSE can have many STUDENTs enrolled (One-to-Many: 1:N)
- One ADMINISTRATOR manages many STUDENT records (One-to-Many: 1:N)
- STUDENT and COURSE are linked through the STUDENT_COURSE junction table (Many-to-Many: M:N)

DATABASE STRUCTURE

The database structure defines the tables used in the Student Management System along with their fields, data types, sizes, and key constraints. It ensures proper data organization, storage, and retrieval for efficient system performance. The system uses MySQL as the database management system.

1. STUDENT TABLE

Field Name	Data Type	Size	Key	Description
Student_ID	INT	10	**PK**	Unique student identifier
Student_Name	VARCHAR	100		Full name of the student
Reg_No	VARCHAR	20	**UQ**	Unique registration number
Roll_No	VARCHAR	20		Student roll number
Email	VARCHAR	100		Email address
Phone_Number	VARCHAR	15		Contact number
Address	TEXT	—		Residential address
Section	VARCHAR	10		Section (A / B / C)
Course_ID	INT	10	**FK**	Reference to Course table
Password	VARCHAR	100		Hashed login password

2. COURSE TABLE

Field Name	Data Type	Size	Key	Description
Course_ID	INT	10	**PK**	Unique course identifier
Course_Name	VARCHAR	100		Full name of the course
Semester	INT	2		Semester number (1–6)
Department	VARCHAR	100		Department name
Duration	VARCHAR	20		Duration (e.g., 3 Years)

3. ADMINISTRATOR TABLE

Field Name	Data Type	Size	Key	Description
Admin_ID	INT	10	**PK**	Unique admin identifier
Admin_Name	VARCHAR	100		Full name of administrator
Email	VARCHAR	100	**UQ**	Admin email address
Phone_Number	VARCHAR	15		Contact number
Password	VARCHAR	100		Hashed login password

There are a total of 3 core tables in the Student Management System: Student, Course, and Administrator, along with a Student_Course junction table for handling course enrollments. Primary

Keys ensure unique identification of records, while Foreign Keys maintain referential integrity between tables.

REFERENCES / BIBLIOGRAPHY

The successful completion of the Student Management System project was made possible with the help of various books, websites, and online resources. These references provided valuable knowledge about programming, database management, web development, and system design.

INTERNSHIP DETAILS (MANDATORY)

Company Name	Ardent Computech Pvt. Ltd.
Company Address	Module 103, SDF Building, Sector V, Salt Lake, Kolkata – 700091
Email	internships@ardentsoftware.in
Contact Number	033-40073507
Duration of Internship	6 Weeks (September 02, 2025 to October 18, 2025)
Internship Start Date	September 02, 2025
Internship End Date	October 18, 2025
Nature of Work / Training	Web Designing with HTML5, CSS3, JavaScript, jQuery, AJAX
Project Title	School / College Management System
Certificate ID (Mashid Ali)	ARDENT/172101

Name of Supervisor / Mentor	Neha Kumari

INTERNSHIP CERTIFICATE

The certificate is issued by Ardent Computech Pvt. Ltd. (An ISO 9001:2015 IT Services Company) and include the following details as required:

- Student Name: Mohammad Mashid Ali
- University: Netaji Subhas University, Jamshedpur
- Technology Domain: Web Designing with HTML5, CSS3, JavaScript, jQuery, AJAX
- Project Title: School / College Management System
- Internship Duration: September 02, 2025 to October 18, 2025 (6 Weeks)
- Certificate signed and stamped by Director – Technology Services & Director – Operations, Ardent Computech Pvt. Ltd.

Thank
You
